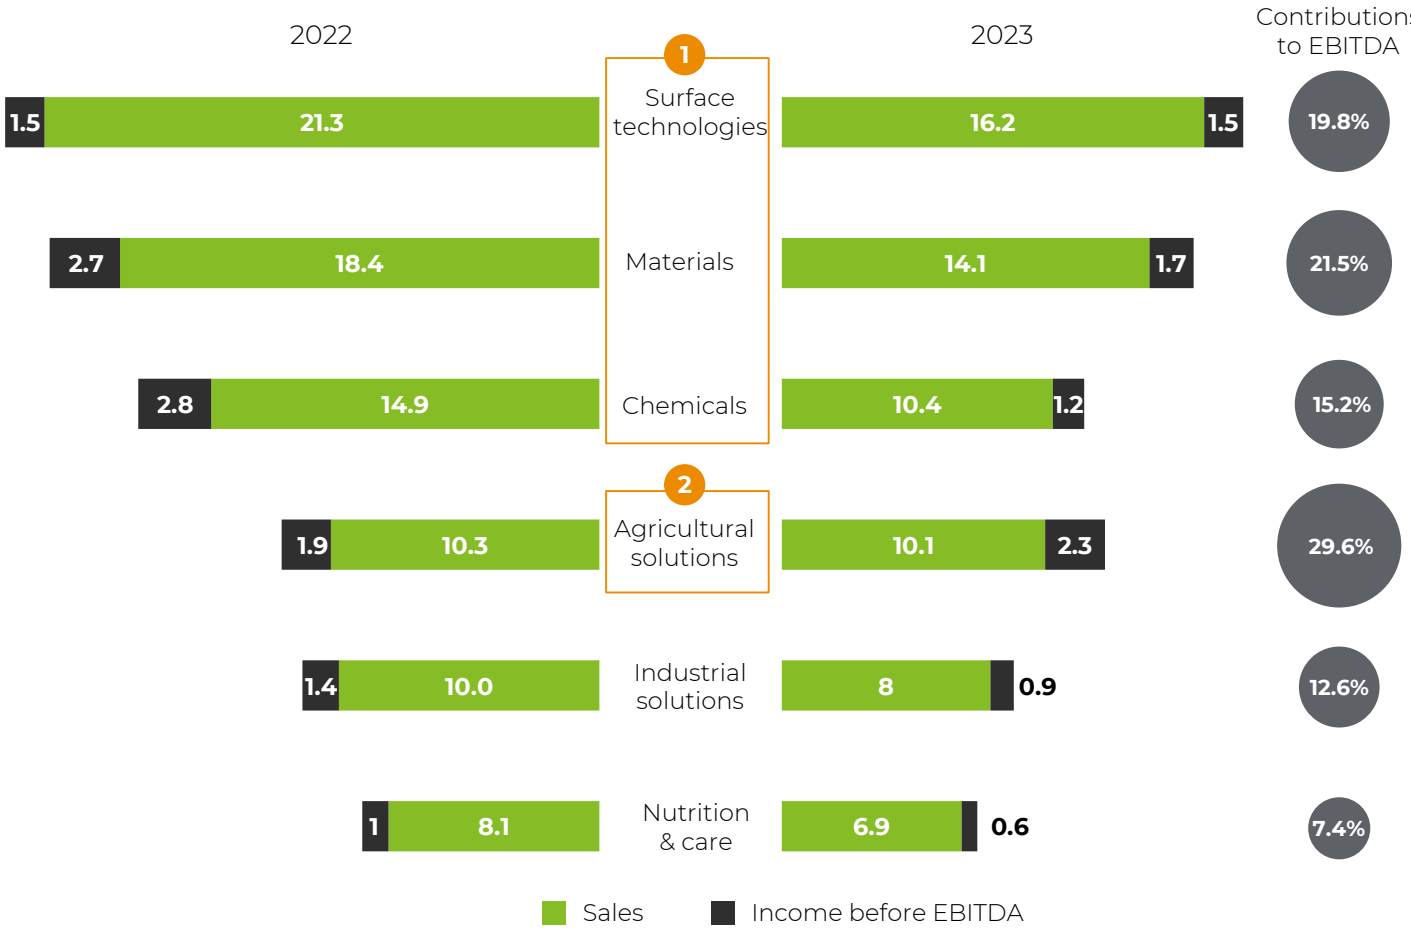
BASF business review by segment, EURO bln



Key findings [1]

[1] BASF likely **faces market or cost pressures** in Surface Technologies, Chemicals, and Materials, which traditionally had high revenues.

[2] Strength in Agricultural Solutions suggests resilience or growth in demand/pricing – possibly a strategic area to expand.

Performance across the board shows margin pressures as EBITDA declined more steeply than sales in several segments.

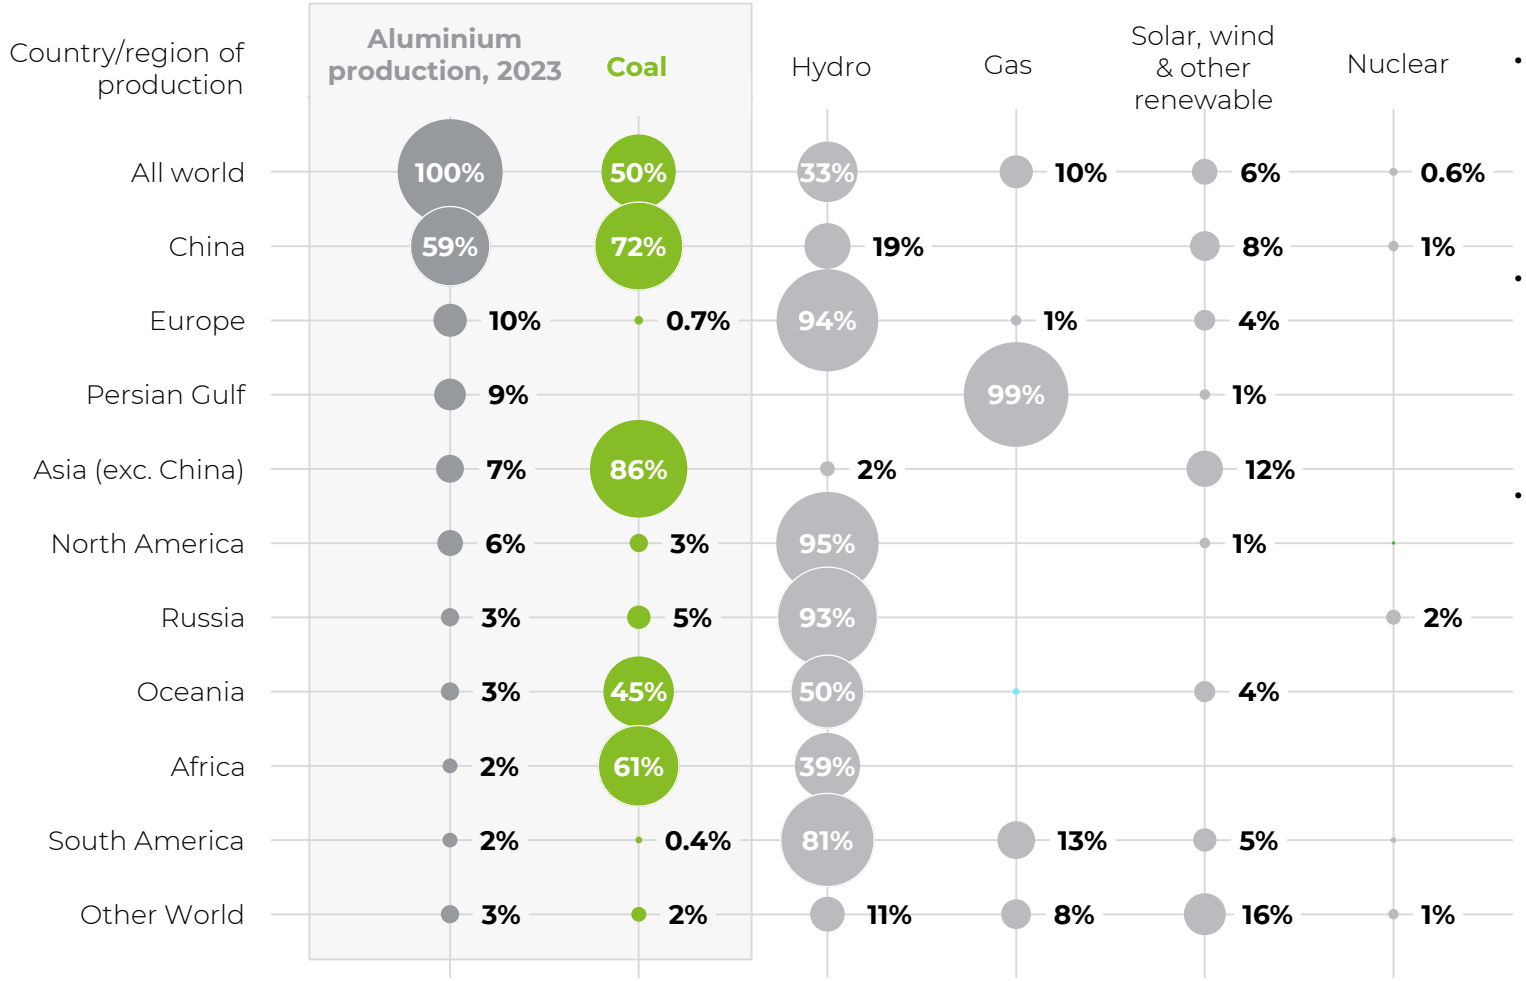
Electricity sources for aluminum smelting, 2023



- Fossil fuels remain the primary source of electricity used in smelting, with coal accounting for 50% globally. The carbon anode emits carbon dioxide as byproducts when consumed during the smelting process.
- Aluminium smelting is a continuous electrolytic process that requires significant quantities of electrical energy. The key to decarbonisation is to increase renewables energy consumption share.
- By shifting to 100% renewable energy for this process, 80% of global aluminium electrolysis related emissions can be reduced.

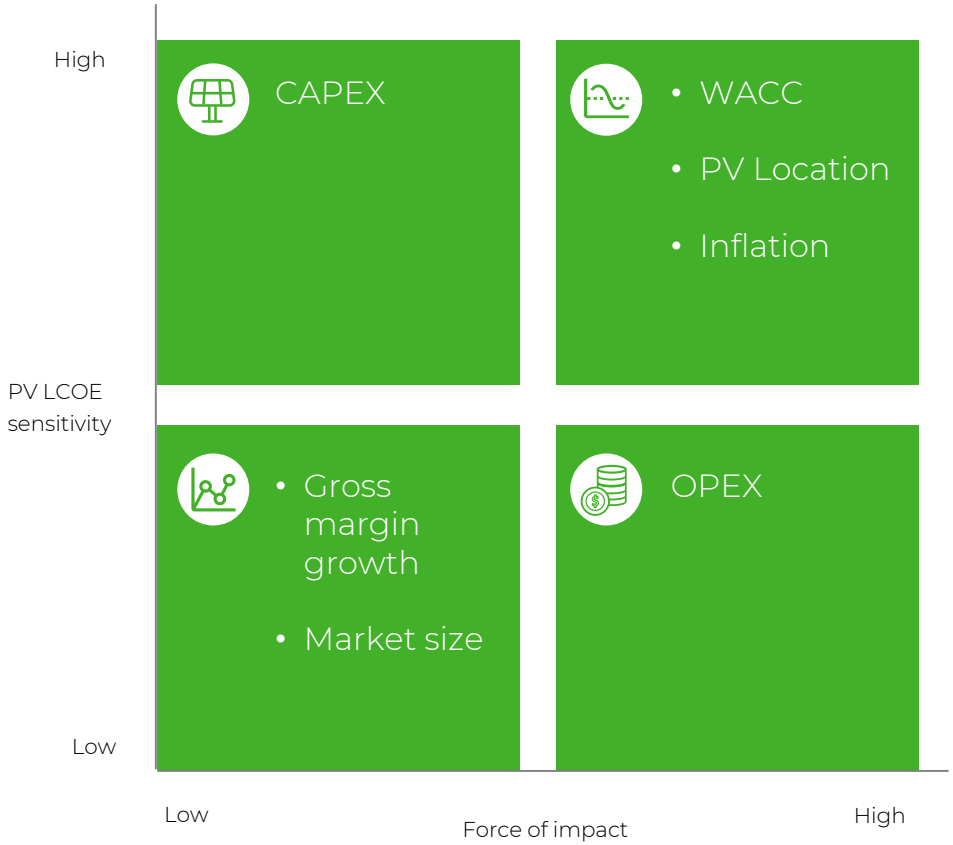
Matrix (1/2)

Important input parameters in the calculation of PV [1] LCOE [2]



[1] Solar photovoltaics
[2] Levelised cost of electricity

Source: Wiley
Data research & chart: I. Daraev

Key findings

- **The weighted average cost of capital** (WACC) is the most crucial parameter affecting the PV LCOE. Increasing nominal WACC from 2 to 10% will double the LCOE.

  WACC used in the LCOE calculation is the single most important input parameter, more important than CAPEX and comparable to yield.

- Since there is no fuel costs related to PV, the **CAPEX** has a relatively stronger influence than the OPEX on PV LCOE.

  Since PV has no fuel cost and relatively small OPEX, the **CAPEX**, paid up front of the investment, becomes an important term in the LCOE calculation

  Obviously, **system size** has an impact on the share of CAPEX and OPEX in the LCOE.

- Changes in PV CAPEX and OPEX, learning rates, or market volume growth scenarios have a relatively smaller impact on future PV LCOE.

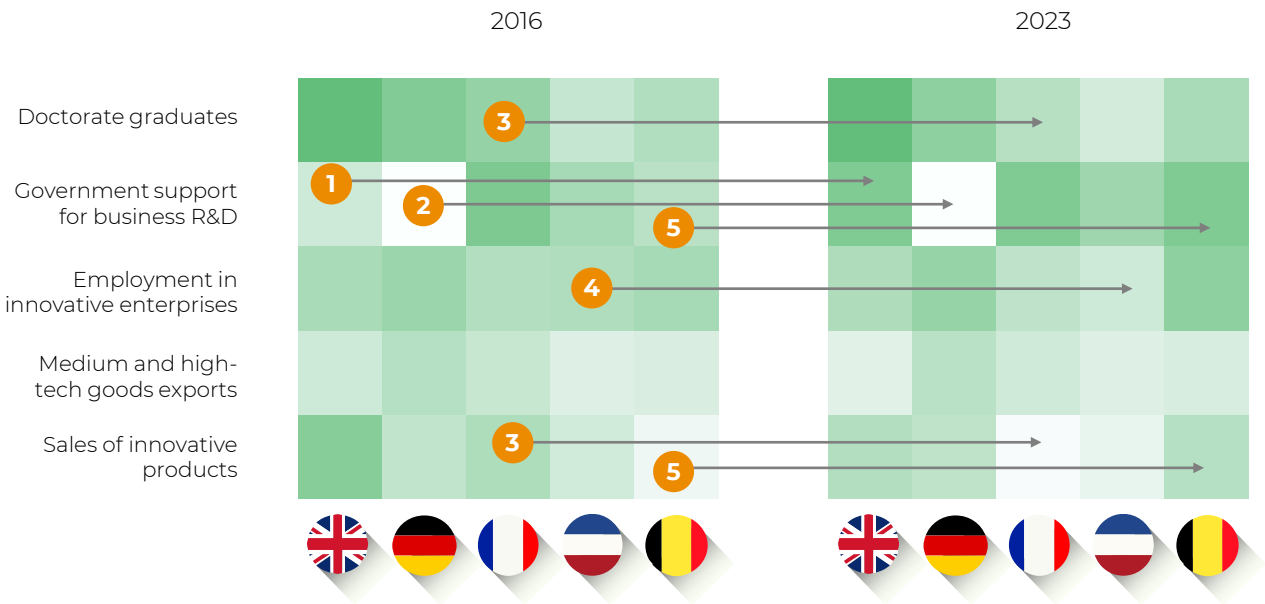
Key innovation performances (relative to EU) [1]



Data research, analysis (key findings) & design: I. Daraev
[1] Source: European Commission – European Innovation Scoreboard 2023

Key findings

[1] The **UK** remains consistently high in Doctorate graduates. And during the period under review, Government support for business R&D has also increased significantly and Sales of innovative products have decreased slightly

[2] **Germany's** indicators have remained largely unchanged, but it is worth noting that Germany stands out among other countries in this sample for its lowest level of Government support for business R&D, which has not changed over 2016-2023

[3] **France** is also characterized by the absence of significant changes in the indicators for the specified period. At the same time, Sales of innovative products fell noticeably (the most noticeable fall compared to other countries) and the level of Doctorate graduates decreased slightly. France is also characterized by a high level compared to other countries of Government support for business R&D (but less than in the UK)

[4] The **Netherlands** shows a slight decline across all indicators, with the decline in Employment in innovative enterprises standing out more noticeably than others

[5] **Belgium** sees growth in Government support for business R&D and Sales of innovative products

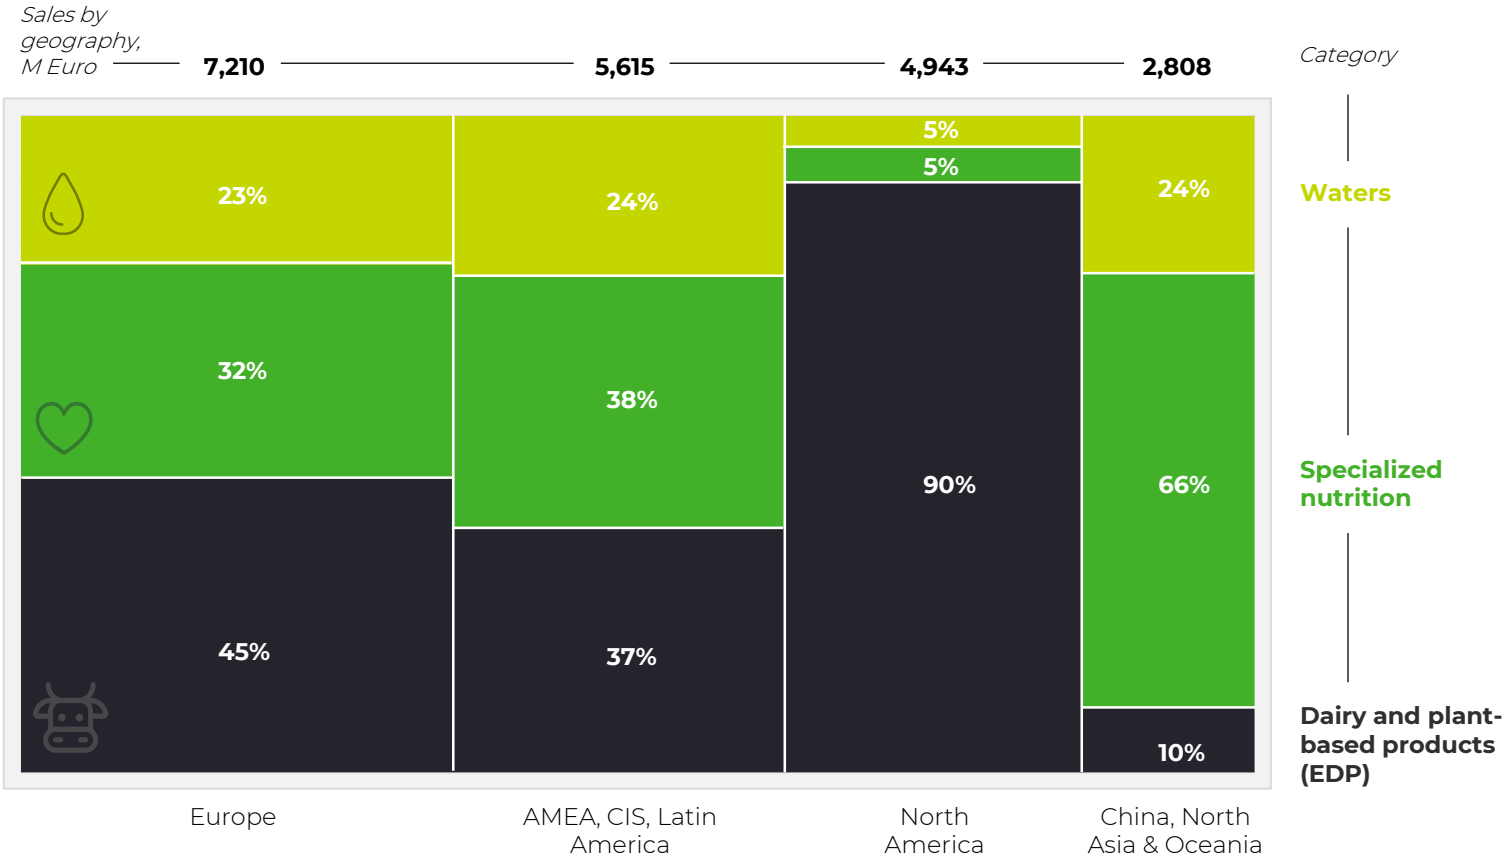
Danone 9M 2024 sales by category and geography



Key findings [1]

The largest sales in North America are for Dairy and plant-based products (90%). These products are also more popular among European buyers (45%).

In Asia, buyers most often buy Specialized nutrition (66%).

While in AMEA, CIS and Latin America, all Danone products are equally in demand with a slight advantage for Specialized nutrition and Dairy and plant-based products (38% and 37%, respectively).

The largest sales volume is in Europe (35%). The least Danone products for 9M 2024 were purchased in Asia (14% of all sales).

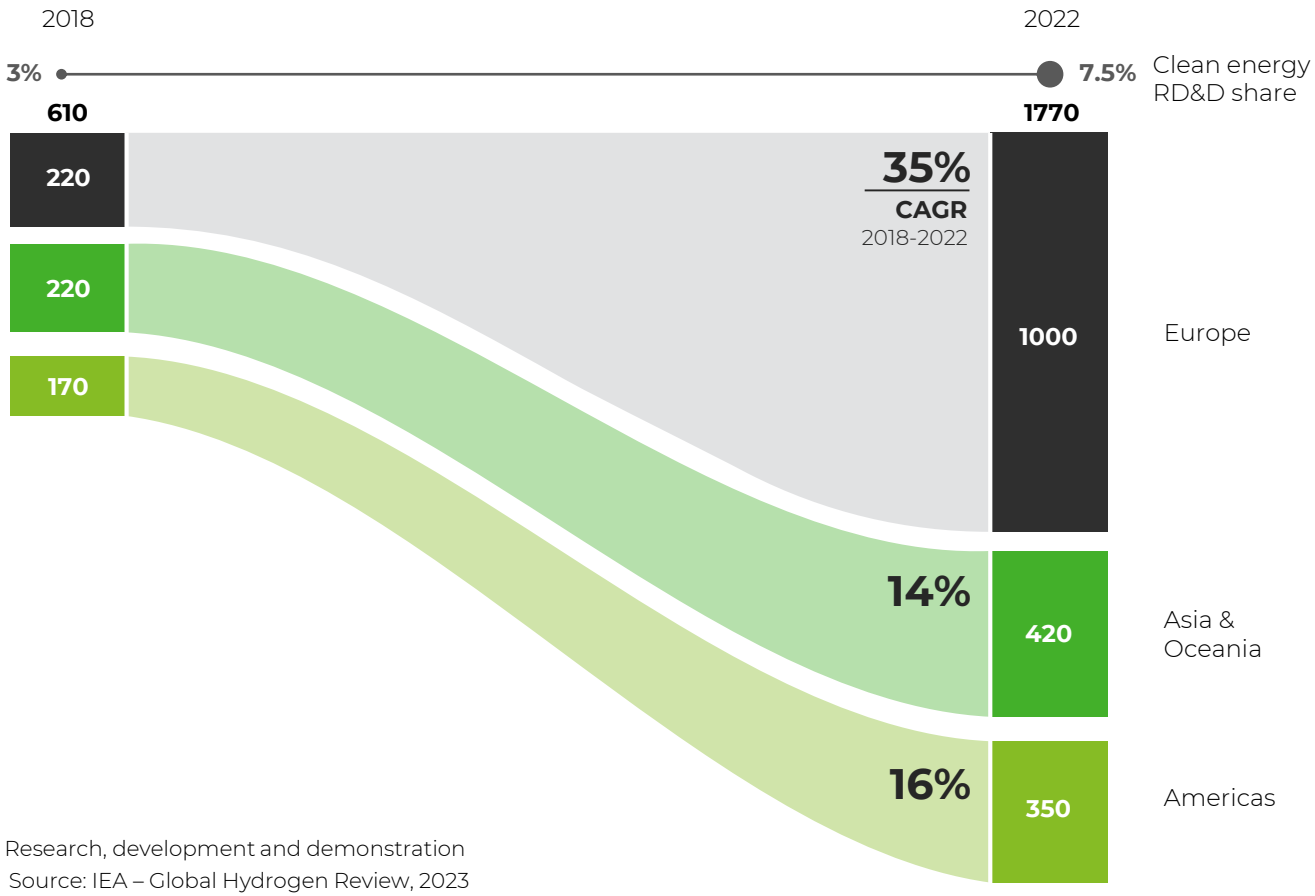
Government RD&D[1] spending for hydrogen technologies by region, 2018-2022, USD m



Government investment in RD&D in hydrogen technologies increased strongly in 2022. This represents a continuation of the trend observed since the mid-2010s, which has accelerated in the past two years.

The growing interest of governments in the development of hydrogen technologies is also represented by the increased share allocated to hydrogen in clean energy RD&D budgets, which reached its historical maximum at 7.5% in 2022
